

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

Read more about Early Journal Content at http://about.jstor.org/participate-jstor/individuals/early-journal-content.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

PROCEEDINGS

OF THE

AMERICAN PHILOSOPHICAL SOCIETY,

HELD AT PHILADELPHIA. FOR PROMOTING USEFUL KNOWLEDGE.

Vol. XXX.

DECEMBER, 1892.

No. 139.

On the Mutual Relations Between the Orbits of Certain Asteroids.

By Daniel Kirkwood, Riverside, Cal.

(Read before the American Philosophical Society, September 2, 1892.)

The present writer, several years since, * called attention to the fact that in some parts of the asteroid zone the orbits of particular members have a striking resemblance to each other. These significant coincidences have been regarded by astronomers as worthy of study, and, in addition to the binary and ternary clusters pointed out by the writer, others have been designated by Tisserand, † of Paris, and by Monck, of Dublin.‡ These groups, according to the former, cannot be regarded as chance arrangements. "A glance at the list," says Mr. Monck, "will show that the resemblance frequently extends beyond a single pair and embraces what may be called a family—a circumstance which is known to occur in the case of comets also." The writer's list (which might be extended) is as follows:

GROUPS OF ASTEROIDS.

		NAMES.		e	i		π

Note.—a, e,i and π represent the distances, eccentricities, inclinations and perihelia respectively.

REMARKS.

1. The second cluster has eleven known members, the average inclination being about 3° 35′, that is, no one differs from the mean as much as 2°. Of the other groups, several are not less striking in the closeness of their relations.

2. When the earth, as well as Mars itself, was yet a part of the solar atmosphere, these individual planetoids were starting on the paths prescribed them. Into how many nebulous fragments they may have been subdivided, and to what extent these ramifications may yet be traced, let the astronomer of the future inquire.
